OPEN TO ENTRY-LEVEL ROLES · HYDERABAD

Pragati Kote

AWS Cloud and DevOps engineer. I write infrastructure as code, ship it through CI/CD, and set up the alarms that say when it breaks.

See my projects | GitHub profile

From my project: multi-tier VPC on AWS, defined in Terraform.

ABOUT

Fresher with four working AWS and DevOps projects.

I finished my BCA in 2025 and then trained in AWS and DevOps at Naresh Technologies in Hyderabad. Since then I have built things end to end: networks in Terraform, containers on EC2 with Jenkins, a Kubernetes deployment, and monitoring with alerts.

Each project below links to its repository, so you can read the code and the README yourself.

> **Bachelor of Computer Applications, 2025**
> College of Computer Science & Information Technology, Latur (SRTM University, Nanded) · CGPA 8.29

> **AWS & DevOps training**
> Naresh Technologies, Hyderabad

PROJECTS

What I have built

`Terraform · AWS networking`

AWS Multi-Tier VPC Architecture

A highly available network built from scratch with Terraform: public and private subnets across two Availability Zones, an Application Load Balancer, and an Auto Scaling Group of EC2 instances.

- VPC `10.0.0.0/16` with public subnets for the NAT Gateway and ALB, and private subnets for the app servers with no public IPs.
- Security groups chained to each other, so app instances accept HTTP only from the load balancer and SSH only from one admin IP.
- Auto Scaling target-tracking policy that scales out when CPU goes above 60%.

BankMate: Multi-Container Deployment Pipeline

A multi-service application run with Docker Compose on AWS EC2 and deployed automatically by a Jenkins pipeline.

- Four services: a web app, an API layer, a MySQL database and an Nginx reverse proxy that routes `/` to the web app and `/api/` to the API.
- MySQL data kept on an EBS-backed Docker volume, so it survives container restarts.
- Jenkinsfile that clones the repo, builds, deploys and verifies the stack on every build.

Terraform · Observability

AWS Monitoring & Alerting Pipeline

A Terraform-built monitoring stack that watches EC2 health and account activity, and sends alerts to email in real time.

- CloudWatch alarms for CPU above 75% over four minutes, EC2 status check failures, and unusual outbound network traffic.
- SNS topic that sends alarm state changes to an email subscription. I tested it end to end by stressing the CPU on the instance.
- Multi-region CloudTrail with log file validation, writing to a private S3 bucket locked to the CloudTrail service.

`Terraform` `CloudWatch` `SNS` `CloudTrail` `S3`

Docker · GitHub Actions · Kubernetes

Node App DevOps Task

A small Node.js server packaged with Docker, checked by a GitHub Actions pipeline, and deployed to Kubernetes on Minikube.

- CI on every push and pull request: install dependencies, run a syntax check, and build the Docker image tagged with the commit SHA.
- Kubernetes Deployment with 2 replicas and readiness and liveness probes, exposed through a NodePort Service.
- The README records the problems I hit and how I fixed them, such as the app having no test suite and an end-of-life Node version in `package.json`.

SKILLS

Tools I work with

AWS

EC2, S3, VPC, IAM, ECS, EKS, RDS, CloudWatch, CloudTrail, SNS, ALB, Auto Scaling

---

Infrastructure as code

Terraform

Containers

Docker, Docker Compose, Kubernetes

CI/CD

Jenkins, GitHub Actions

Foundations

Linux, Python, Git and GitHub

CONTACT

Hiring for an entry-level cloud or DevOps role?

The quickest way to see how I work is the code. Every repository above has a README that explains the design and how to run it.
